

alexandria.

investment memo

Most AI investments cannot defend their terminal value.

Alexandria's compounds when a new model ships.

The cognitive layer of AI — where human minds remain machine-readable across the transition.

the investment.

Most AI products are transition assets — value decays into the model with each release. Alexandria's asset is a **private, accumulating, machine-readable record of how a specific person thinks** — sovereign to the user, unsynthesizable from outside, *worth more from every better model*. The strategic prize is the canonical write path for those records: same shape as WordPress, GitHub, Hugging Face. Winner-takes-most. Technical and survival risks are zero. **The only existential question is demand. That is the only thing capital is for.**

In April 2026 Andrej Karpathy publicly described this architecture — "LLM Knowledge Bases... raw data compiled into structured markdown that compounds with every model release... there is room here for an incredible new product." Alexandria had already shipped it.

the asset.

A structured record of who each user is — worldview, values, mental models, taste, blind spots — accumulated decision by decision through daily Socratic sessions. Local files the user owns. Portable across every AI provider. *The record cannot be back-filled: inbox-scraping reaches what the user does, never what they mean. Five years of biographer-interviews cannot be compressed into a six-month rush.*

The compounding is the years.

Engineering is done. One curl command. Ten dollars a month, free with five referred friends, slider open above. The only open question is whether enough people want it.

the moat.

No technical moat — *by design*. The moats that compound in a world of infinite intelligence are social, cultural, and infrastructural.

The convention slot. *"If you take your thinking seriously, you have one of these."* Same shape as *build-it-on-WordPress, push-it-to-GitHub, host-it-on-Hugging-Face*. Winner-takes-most. **12–36 month window. Move as if 12.**

The tribe. Not a network effect — *an identity*. People do not leave tribes because a bigger tribe launches. **Apple can build the tool. Apple cannot build the cathedral.**

the business.

Subscription. *\$10/m baseline, slider open above.* Stands alone. Break-even at 10 paying users.

Platform. *Permissioned access for AI labs (alignment, personalisation), plus every service that serves a user better when it knows who they are.* Independent of user count.

If	Then
~100K paying users × \$50/m settled	~\$60M ARR
Platform / integration revenue	~\$40M+ ARR
Combined at standard 10× SaaS multiple	\$1B+ valuation

the founder.

Benjamin Mowinckel. 26, Norwegian-American. Eton, Princeton, Norwegian military, brief stint at Verdane (Oslo growth equity — carbon-removal project, then decarb sourcing). Currently in San Francisco. **Solo, running the entire stack on AI agents at \$100/month opex, full-time since March 2026.** Two months from zero to engineering-done.

	\$/m
Company opex	\$100
Founder bare minimum	\$500
Founder safe monthly	\$5,000

He cannot be price-pressured. He cannot be runway-rushed. *Most AI founders solve engineering problems. Benjamin solves the framing problem.*

"I could be wrong. I doubt it. The company costs \$100 a month. If I am wrong, the world loses nothing. If I am right and nobody builds this, the world loses something it did not know it needed. Either way, I am building it."

the ask.

- **Rung 1 — ~\$100K.** Buffers SF for ~20 months while the demand experiment runs.
- **Rung 2 — ~\$200–500K.** Scales what works. First 1,000 users.
- **Rung 3 — ~\$1M+.** Platform pilot for AI labs. First public referee on the cap table.

Capital accelerates the demand experiment — the company does not need the money. The founder builds regardless. Entry price is lowest now.

*The firm whose name attaches goes on the page about how humans preserved thinking through the AI transition. **America protects the right to think. Alexandria protects the ability.** Set the angels free.*
